

### HSC Safety Tips No. (4)

1. **DO NOT** correct mistakes! If non-hazardous materials have been placed in a hazardous waste container that wastes **MUST** be now considered hazardous.
2. Segregating wastes at source is the best way to reduce the volume of hazardous wastes requiring special treatment. **ALWAYS** sort your wastes out at source and place them in the right container.
3. To **DISINFECT** the biological safety cabinet from spills, use 70% ethanol or isopropanol. If you use a bleach solution, follow with isopropyl alcohol to remove residues.
4. **DO NOT** use chemical fume hoods to evaporate hazardous chemicals or as a means of chemical disposal. All chemicals inside the hood must remain capped when not in use.
5. **DO NOT** wear sandals, open-toe shoes or perforated shoes inside the laboratories. Wear **ONLY** closed-toe, sturdy shoes such as durable sneakers or boots.
